Knowledge quiz

1. What is electrolysis?
2. What is the charge on the cathode?
3. Why does the ionic compound being electrolysed need to be molten or dissolved?
4. Why does aluminium need to be extracted from aluminium oxide using electrolysis?
5. Why is cryolite used during the electrolysis of aluminium oxide?
6. Why does the anode need periodically replacing during the electrolysis of aluminium oxide?
7. What is the name of the positive electrode in electrolysis?
8. What would form at the anode and cathode during the electrolysis of **molten** sodium chloride?
9. During the electrolysis of sodium chloride **solution** hydrogen forms at the anode, explain why.
10. What will form at the anode during the electrolysis of of copper sulfate solution?

Knowledge quiz - Answers

1. What is electrolysis? The breaking down of ionic compounds using electricity
2. What is the charge on the cathode? Negative
3. Why does the ionic compound being electrolysed need to be molten or dissolved?
So the ions are free to move
1. Why does aluminium need to be extracted from aluminium oxide using electrolysis?
Aluminium is more reactive than carbon, so carbon can not remove the oxygen from aluminium oxide.
1. Why is cryolite used during the electrolysis of aluminium oxide? Cryolite lowers the melting point of the aluminium oxide, reducing energy costs.

Knowledge quiz - Answers

6. Why does the anode need periodically replacing during the electrolysis of aluminium oxide? Oxygen produced at the anode reacts with the carbon anode forming carbon dioxide, this wears away the anode.
7. What is the name of the positive electrode in electrolysis? Anode
8. What would form at the anode and cathode during the electrolysis of **molten** sodium chloride? Anode = chlorine Cathode = Sodium
9. During the electrolysis of sodium chloride **solution** hydrogen forms at the anode, explain why. Sodium is more reactive than hydrogen.
10. What will form at the anode during the electrolysis of of copper sulfate solution? Oxygen

	Extraction of iron from iron oxide	Extraction of aluminium from aluminium oxide
Obtaining the ore	Mined from earth's crust	Mined from earth's crust
Method of extraction	Heating with carbon	Electrolysis
Cost of extraction per tonne (£)	500	1500
Energy needs of extraction per tonne (KJ)	750	1000
Solid waste produced per tonne of metal extracted (tonnes)	800	200

Compare the extraction of iron and aluminium from their ore.

- Similarities
- Differences
- Use comparative language
- Use data to illustrate

Similarities

- Both ores are mined from the earth's crust

Differences

- Iron is extracted from its ore by heating with carbon whereas electrolysis is used for aluminium
- It costs **more** to extract aluminium from its ore, three times more or £1000 per tonne more.
- The energy needs are **higher** to extract aluminium from its ore, 1.5 times more or 375 KJ per tonne more
- **More** solid waste is produced during the extraction of iron, 4 times more or 600 tonnes more.

	Extraction of iron from iron oxide	Extraction of aluminium from aluminium oxide
Obtaining the ore	Mined from earth's crust	Mined from earth's crust
Method of extraction	Heating with carbon	Electrolysis
Cost of extraction per tonne (£)	500	1500
Energy needs of extraction per tonne (KJ)	750	1000
Solid waste produced per tonne of metal extracted (tonnes)	800	200

Evaluate the two methods of extraction of metals from their ore. Use data from the table and your own knowledge.

- Positives and Negatives
- Overall opinion
- Add value to the information do not just repeat it!

Iron/heating with carbon

Positives

- The energy needs and costs are lower, x1.5 and x3 lower, so it is cheaper

Negatives

- The ore is mined from the earth's crust this will destroy habitats and create noise/dust pollution.
- A larger amount, x 4, of solid waste is produced which will need to be disposed of and take up space in landfill, which affects habitats

Aluminium/Electrolysis

Positives

- Produces less solid waste so less waste going to landfill

Negatives

- Aluminium needs electrolysis for extraction due to being more reactive than carbon.
- The energy needs and costs are much higher due to the electricity needed for electrolysis.
- The ore is mined from the earth's crust this will destroy habitats and created noise/dust pollution.

Overall opinion - Heating with carbon is the best option for extracting a metal from its ore as it is cheaper and has lower energy needs, however, this method can only be used if the metal is less reactive than carbon.
