Electrolysis recap

Electrolysis is the use of _____ to _____ a compound

_____ attracts _____ ions

_____ attracts _____ ions

_____ has to be _____ or _____ so the _____ can move

Source Mr Campbell

Independent task

1. Explain why can aluminium not be extracted from aluminium oxide by heating with carbon.
2. Identify what is formed at the anode and the cathode during the electrolysis of aluminium oxide.
3. Explain why cryolite is used to dissolve the aluminium oxide during electrolysis.
4. Explain why the anode needs replacing during the electrolysis of aluminium oxide.

Independent answers

1. Aluminium is more reactive than carbon. So carbon can not displace the aluminium from aluminium oxide.
2. Cathode = aluminium Anode = oxygen
3. Cryolite lowers the melting point of the aluminium oxide reducing the energy costs of the electrolysis.
4. The oxygen produced at the anode reacts with the carbon in the (graphite) electrode forming carbon dioxide.
