Titration method

1. Fill the with acid.
2. Use a to measure 25cm^3 of alkali into the conical flask.
3. Add an to the alkali.
4. Take the initial reading on the .
5. Add the acid to the alkali while the conical flask.
6. Stop adding the acid when the indicator changes colour. Record the final reading on the burette - This is your rough titration.
7. Repeat the titration this time adding near the end point.
8. Repeat until results are achieved.

Titration calculation

A student added 25cm³ of an unknown concentration of sodium hydroxide into a conical flask. They carried out a titration using 0.100 mol/dm³ of hydrochloric acid. The mean volume of hydrochloric acid needed to exactly neutralise the acid was 26.50cm³. Calculate the concentration of the sodium hydroxide.

Titration calculation

A student added 25cm³ of 0.150mol/dm³ of sodium hydroxide into a conical flask. They carried out a titration using an unknown concentration of citric acid. The results of the titration are shown below. Calculate the concentration of the citric acid.

	Titration 1	Titration 2	Titration 3	Titration 4	Titration 5
Volume of $\text{C}_6\text{H}_8\text{O}_7$ added in cm ³	12.50	11.10	10.20	10.15	10.15

Independent task

A student titrated 25cm³ of 0.075 mol/dm³ of sodium hydroxide with an unknown concentration of sulfuric acid. The mean volume of sulfuric acid added was 17.55cm³. Calculate the concentration of the sulfuric acid solution.

1. Calculate moles of sodium hydroxide using moles = concentration x volume (remember to make sure your volume is in dm³)
2. Use the ratio from the balanced equation to work out moles of H₂SO₄
3. Calculate the concentration of H₂SO₄ using concentration = moles/volume (remember to make sure your volume is in dm³)

Independent task answer

Moles (NaOH) = concentration x volume

$$25\text{cm}^3 = 0.025\text{dm}^3$$

$$\text{Moles NaOH} = 0.075 \times 0.025 = 1.875 \times 10^{-5} \text{ (0.00001875)}$$

Independent task answer

Ratio of NaOH:HCl 2:1

So moles of HCl = $1.875 \times 10^{-5} / 2 = 9.375 \times 10^{-6}$

Concentration (HCl) = moles/volume

Volume of HCl = 17.55 cm^3 so 0.01755 dm^3

Concentration = $9.375 \times 10^{-6} / 0.01755 = 5.3 \times 10^{-4} \text{ mol/dm}^3$

Independent task

A student carried out a titration using 25cm³ of 0.200 mol/dm³ HCl. NaOH was added to the HCl and the volume needed to neutralise the HCl was recorded. Use the results of the titration to calculate the concentration of NaOH.

	Titration 1	Titration 2	Titration 3	Titration 4	Titration 5
Volume of NaOH added in cm ³	12.50	11.10	10.20	10.15	10.15

1. Calculate moles of HCl using moles = concentration x volume (remember to make sure your volume is in dm³)
2. Use the ratio from the balanced equation to work out moles of NaOH
3. Calculate the mean volume of NaOH using the concordant results from the titration.
4. Calculate the concentration of NaOH using concentration = moles/volume (remember to make sure your volume is in dm³)

Independent task answer

1. Moles (HCl) = $0.200 \times 0.025 = 5 \times 10^{-3}$
2. Ratio HCl:NaOH 1:1 so moles of NaOH = 5×10^{-3}
3. Mean volume of NaOH = 10.15 cm^3
4. Concentration of NaOH = $5 \times 10^{-3} / 0.01015 = 0.493 \text{ mol/dm}^{-3}$
