

Purity and Formulations Worksheet

Combined Science - Chemistry - Key Stage 4

C8 Analytical Chemistry

Mr Robbins

Periodic Table of Elements

Key:

relative atomic mass

Atomic symbol

Name

Atomic (proton number)

1

H

hydrogen

1

* The lanthanides (atomic numbers 58 - 71) and the Actinides (atomic numbers 90 - 103) have been omitted.

Relative atomic masses for **Cu** and **Cl** have not been rounded to the nearest whole number.

1. A student pours some mineral water into a glass. Is it a pure or impure substance?
2. A student receives a bottle of pure ethanol. In their textbook it says that ethanol's boiling point is 78°C . What temperature will they have to heat it to in order to turn it into a gas?
3. They find that it starts to turn into a gas at 81°C . What can they conclude about the ethanol's purity?
4. Ethanol is a simple molecular substance. Does it conduct electricity?
5. Explain your answer to the previous question.
6. A student wants to make a formulation of liquid chemicals X, Y and Z. First they take a small amount of Y and add it to X. Explain how the student could use the mixture's boiling point to prove that it is an impure substance.
7. There is a naturally occurring mixture of Y and Z that can be extracted from trees. A different student says that because it is natural it is a pure substance. Explain why the student is incorrect.
8. Explain why it is important that the student measures the volumes of X, Y and Z when mixing them together.
9. The resulting mixture can be separated back into X, Y and Z. Which process can be used for this separation?
10. Alloys can be considered as formulations. What is an alloy?
11. Explain why alloys are harder than pure metals.
12. A scientist wishes to make an alloy of iron and carbon for use as a car body. Explain why it is important that the scientist uses precise amounts of carbon when making the alloy.

1. Impure as it is a mixture of water and dissolved minerals
2. 78 °C
3. It is impure
4. No
5. No delocalised electrons or ions to flow
6. Its boiling point will be higher than pure X
7. It is wrong because it is a mixture s cannot be pure
8. To ensure they get the correct quantities for the formulation
9. Distillation
10. A mixture of a metal with another metal or carbon
11. The rows of metal ions are disrupted so they cannot slide past each other
12. Too much or too little will affect the malleability/ability to shape/properties of the metal

Quick check

1. What happens to the boiling point of an impure substance?
2. What happens to the melting point of an impure substance?

Independent task

1. Which of the halogens are liquid at room temperature (25 °C)?
2. Which are gases at room temperature?
3. Describe how we could determine the purity of a sample of iodine
4. Sketch a graph to show what will happen to the temperature of a pure sample of Astatine when it is heated from a starting temperature of 250 °C. Label the values of the melting and boiling point.

Halogen	Melting Point (°C)	Boiling Point (°C)
Fluorine	-220	-188
Chlorine	-101	-35
Bromine	-7.2	58.8
Iodine	114	184
Astatine	302	337

Independent task

1. What is a formulation?
2. What is the main reason for a product having a formulation?
3. Why do some cleaning products have flavourings or colourings added?
4. Why are some pills covered in sugar?
